In the Specification:

Please replace paragraph [0024] with the following new paragraph showing the change:

[0024] In another exemplary embodiment, user interface class system 110 and handler class system 112 can provide the components, options, and states required to interface with a server system, such as that disclosed in U.S. Patent **Application** 09/689,067, entitled "System and Method for Enterprise Resource Management," filed October 12, 2000, which is hereby incorporated by reference for all purposes. In this exemplary embodiment, the interface system with the server will have predetermined data field and functions, such that the user interface code will have to provide an interface to these data fields and functions. The present invention thus provides a programming environment that allows user interface software to be generated, for modifications to that user interface to be readily made, and for new releases of the user interface code to be compatible with such modifications. In this manner, the need to modify the server software to provide additional user interface functionality is minimized, and the corresponding use of server resources to generate or execute user interfaces is also minimized.
